

QA Testing Approach & Test Plan

Project: E-Commerce Website QA Portfolio

1. Objective

The objective of this testing effort is to evaluate the functionality, reliability, and usability of a simulated e-commerce application through structured manual testing. The project focuses on identifying defects, validating business requirements, and documenting test coverage.

2. Scope

Modules included in scope: Login, Search, Shopping Cart, and Checkout. Testing includes both positive and negative scenarios.

3. In-Scope Features

- Authentication and Login
- Password Validation and Reset
- Session Timeout and Logout
- Product Search Functionality
- Shopping Cart Management
- Checkout and Order Confirmation

4. Out-of-Scope Features

- Performance Testing
- Load and Stress Testing
- Accessibility Testing
- Mobile Device Testing
- Third-Party Payment Gateway Validation

5. Testing Types Used

- Functional Testing
- Negative Testing
- Validation Testing
- Authentication Testing
- Authorization Testing
- Session Management Testing
- Search Relevance Testing

6. Test Environment

Operating System: Windows 11
Browser: Google Chrome (Latest Version)
Testing Type: Manual Testing

7. Entry Criteria

- Application is deployed and accessible.
- Test data is available.
- Requirements have been defined.
- Test cases have been prepared.

8. Exit Criteria

- All planned test cases executed.
- Critical defects documented.
- Test Summary Report completed.
- Traceability Matrix updated.

9. Risks Identified

- Authentication failures may expose protected resources.
- Cart calculation errors may impact revenue.
- Checkout validation defects may prevent order fulfillment.
- Search relevance issues may reduce customer satisfaction.

10. Deliverables

- Test Cases (32)
- Defect Reports (5)
- Requirements Traceability Matrix
- Test Summary Report
- QA Testing Approach & Test Plan

11. Conclusion

This test plan outlines the approach, scope, methodology, risks, and deliverables used throughout the QA portfolio project. It demonstrates structured QA planning and execution practices commonly used within professional software testing teams.
